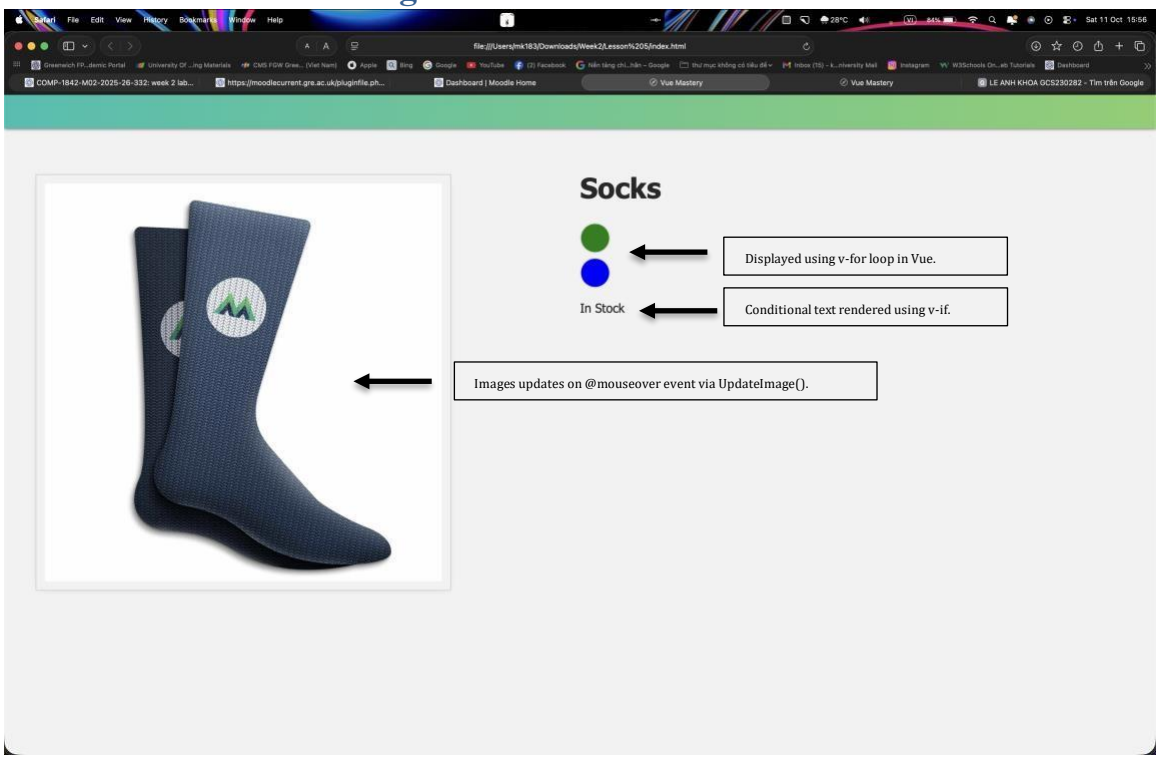
Week 2 Logbook

Name: Le Anh Khoa ID: GCS230282

Lesson 5 –

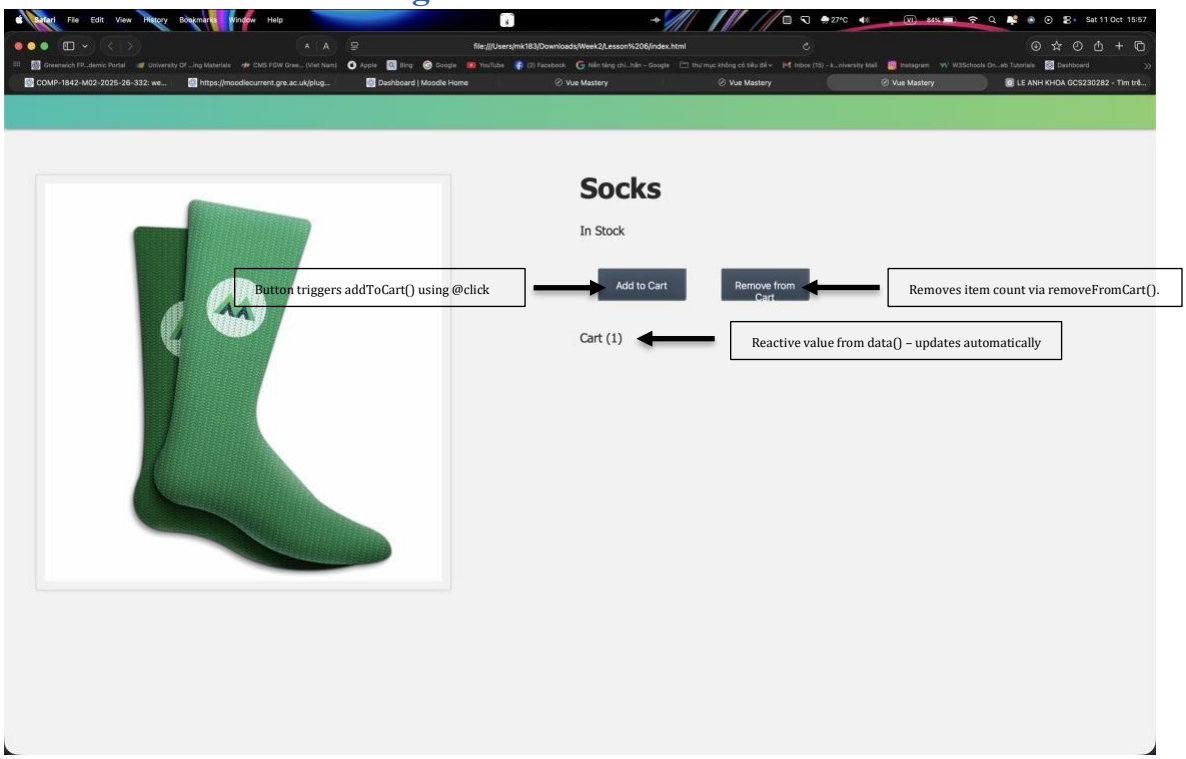
List Rendering



Through this lesson, I gained a clear understanding of Vue's list rendering and dynamic attribute binding mechanisms. By creating a variants array inside the data() object and utilizing the v-for directive, I learned how to efficiently iterate over data to render multiple DOM elements, such as the color circles. Furthermore, by using the @mouseover event and v-bind:src, I realized how Vue can dynamically update the product image in real-time based on user interactions.

Lesson 6 –

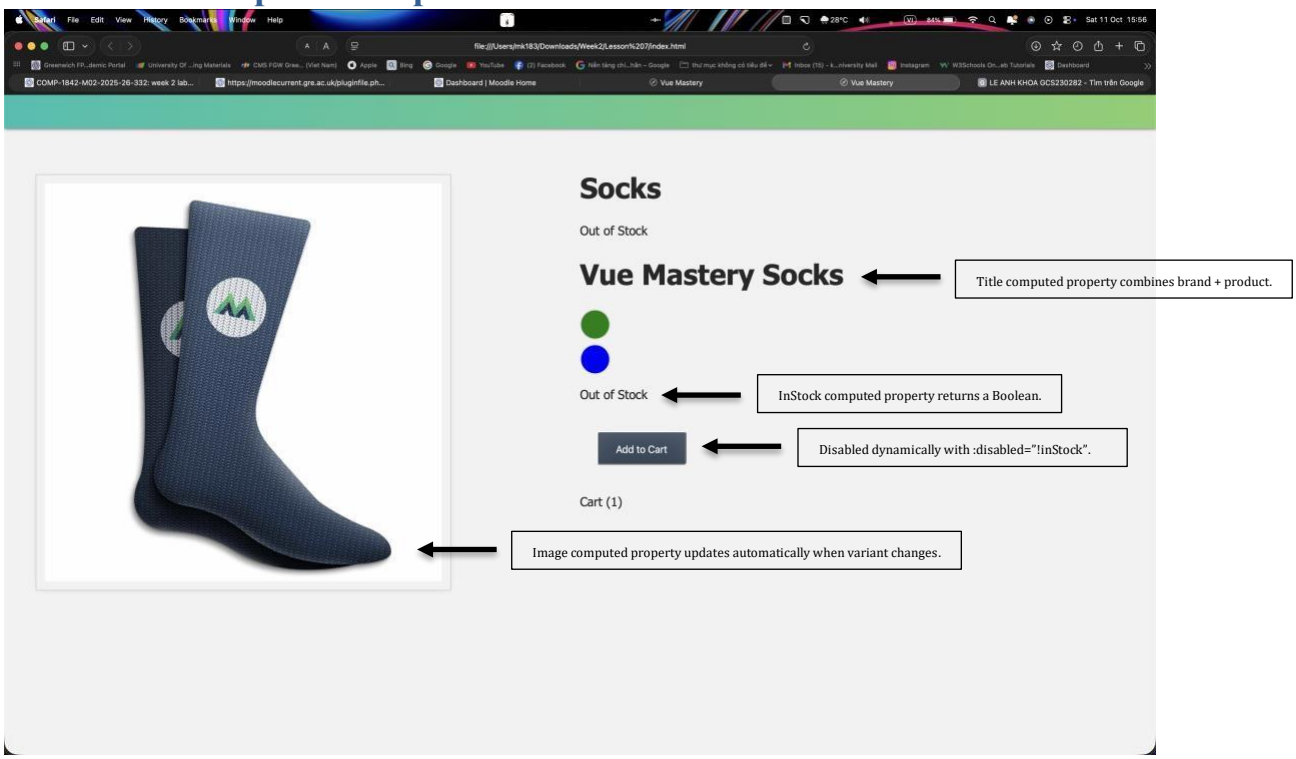
Event Handling



This lesson helped me grasp the concept of event handling using Vue directives. I learned that by defining a method like addToCart() and binding it to a button with the @click directive, I can execute specific logic upon user actions. Because the cart variable in the data() object is reactive , I understand that the interface automatically updates to reflect the increased item count every time the button is clicked.

Lesson 7 –

Computed Properties



I now understand how computed properties can significantly simplify template logic by reacting automatically to data changes. By defining computed properties like title (which combines the brand and product name) , along with image and inStock, I observed that Vue automatically updates these values whenever the selected variant dependencies change. Additionally, applying :disabled="!inStock" to the add-to-cart button practically demonstrated how to effectively manage reactive state control in the UI.
